

ABSTRACT OF THE INVENTION

A tape-moving device for an adhesive tape holder includes a plurality of gears and a handle. The handle can be swung down to rotate together a main gear and an
5 intermediate gear and then a feeding gear in order. The feeding gear has an annular corrugated multi-stage wing for an adhesive tape to stick on. Then the adhesive tape can be pulled out for a restricted length with the feeding gear for a limited length when the handle is swung down
10 and stopped by a limit button adjustably fixed at any point of a curved position groove provided in a holder body. And a knife blade cuts off the tape at the preset length pulled out by the feeding gear.
